The Meaning of Madness
By Neal Burton
Oxford University Press, 2008.
£14.99 (hbk), 2009p.
ISBN: 9780195263301

This book aims to explore what mental disorders can teach us about human nature and the human condition. This ambitious plan, coupled with the fact that the book was written 'over two weeks', means it certainly moves with pace.

Each chapter starts with a description of a mental disorder, which is then used as a way into different territory, often philosophy. Although the intended audience is not made explicit, Burton assumes little prior knowledge of mental disorder, and the text has the feel of a primer pitched at those interested in psychiatry, but not necessarily practising psychiatrists.

As Burton has not defined his audience, he seems to take on responsibility for the reader. For example, when he raises existential questions in a chapter on suicide, he feels the need to advise a potential reader who may be 'struggling with mental disorder and contemplating suicide that ... the bare experience of life is intrinsically valuable'.

A similar responsibility is implied when discussing how bipolar disorder is overrepresented in artists. Burton is careful not to romanticise mental illness and counteracts, almost as a disclaimer, 'All mental disorders are death and intensely painful, and most people who suffer from one would never wish it on anyone, least of all themselves!'

This book's statement perhaps overcompensates, and betrays the sensitive position that the author is in. This tension is fascinating, but on occasion the text swings between different levels of discussion, from educational, to philosophical argument, to didactic advice. I note that the author's previous publications were either 'straight' psychiatry textbooks or self-help books, and these very different registers are sometimes discernible in this book that aims between the two genres.

As a clinician, I found the chapter on depression particularly interesting. Burton points out that the cognitive distortions seen in people with depression are not far removed from the concept of 'depressive realism' - that people with depression see the world more accurately. These people may have 'the healthy suspicion that life has no meaning'. The author acknowledges that this line of argument might be anathema to psychiatrists dealing with the realities of managing depression. However, he is equally forthright in his hypothesis that depression (at least in milder forms) can be adaptive, by signalling that 'something is seriously wrong that

needs working through'. Awareness of this meaninglessness could, he claims, help people to challenge their priorities.

The book does not provide easy solutions; the chapters usually finish with open ends and extended quotations. While this opens up the debate and implies that there are no concrete answers, this form may be the pragmatic result of a complex book written at speed. Its effect is often to give a fresh perspective on a familiar disorder.

Feelings of Being: Phenomenology, Psychiatry and the Sense of Reality
By Matthew Ratcliffe
Oxford University Press, 2008.
£20.95 (hbk), 2008p.
ISBN: 9780195263449

This is not a book for the generalist. It is a specialist text on 'existential feelings', written in the tradition of Husserl, Binswanger and Merleau-Ponty. The author's aim is to 'offer a phenomenological analysis of existential feeling and show how this can be fruitfully applied to psychiatry and refined in the process' (p. 9). The analysis is conducted in a treacherous territory. It is difficult enough to attempt to distinguish between the concepts of 'feelings', 'emotions', 'mood' and 'affect'; given how often these terms are conflated and misunderstood. But to add 'existential feelings' as opposed to physical/physiological feelings into this mix is to complicate matters further. This is the central problem with this book - its currency is imprecise language whereas the analytic work required for a book's success demands rigour and exactitude.

The psychological literature on emotions is well developed, from the James-Lange through to the Cannon-Bard theory and finally to the modern cognitive appraisal theories initially described by Schachter. For William James and Carl Lange, the physiological changes that occur as a result of autonomic response to a given situation are the actual experienced emotions. Thus, we are fearful because our hearts beat rapidly. Walter Cannon and Philip Bard challenged this view in the 1920s. Their hypothesis was that in confronting a stimulus, a subject has a simultaneous emotional response that leads to behaviour. In other words, emotions are simultaneous with the provoking stimuli. Schachter's two-stage theory adds context and cognitive appraisal into the picture such that it is the environmental context that determines the 'emotional label' of particular physiological changes. In this book, Ratcliffe argues for William James' identification of feelings with emotions and in the process assumes that
