

Nucleosides And Nucleotides As Antitumor And Antiviral Agents

NUCLEOTIDE VERSUS NUCLEOSIDE

Nucleotide is composed of a nitrogenous base, sugar and a phosphate group	Nucleoside is composed of only a nitrogenous base and a phosphate group
Precursor of polynucleotides, DNA and RNA	Precursor of nucleotide
Used in signal transduction pathways, sequencing and as an energy source	A diet which is rich in nucleosides would be important for optimal health
LNA, PNA, and morpholino are analogous for the sugar backbone in RNA, regulating the gene expression	Several nucleoside analogues are used as antiviral or anticancer agents
Examples include adenine monophosphate, adenine diphosphate, and adenine triphosphate	Examples include adenosine, thymidine, uridine, guanosine, cytidine and inosine
